Latest Firmware Update for the DR-1X Repeater

Dear DR-1X Operators;
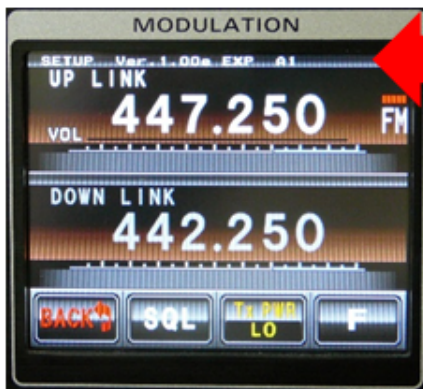

Thank you for your patronage of YAESU products.

Please be informed that we released the latest firmware updates for the DR-1X Repeater.
The update solves a TX Lock-up problem when connecting directly to the HRI-200, and we recommend installation for all DR-1X units.

Before installing the new firmware, please determine the appropriate firmware version for your DR-1X. There are three different firmware versions depending on marketing regions.

To check the firmware version of your DR-1X Repeater;
1. Turn Power ON
2. Press "SET UP" Button on the Operation Mode Screen
3. The current Firmware Version is displayed at the top of the Screen

Please use the appropriated new firmware to provide the listed functions:

V1.00n   Replaces any firmware versions, other than V1.10D and V1.00f.
                Provides **Wide-FM operation**

V1.10J   Replaces V1.10D.
                Provides **Selectable Wide/*Narrow-FM operation** and
                Supports **Connectivity direct to the HRI-200**

V1.00t   Replaces V1.00f (If the DR-1X already has V1.00t, it does not need this update).
                Provides **Selectable Wide/*Narrow-FM operation**
                (*The narrow band deviation is for some European countries.)

Thank you for your attention and continued support of YAESU.
