WIRES-X PC Software ver.1.500 Update Information

Software version

WiRES-X (PC software) ver. 1.420 → ver. 1.500

The new PC software contains the following:

1. Added PDN function: It is now possible to operate a WIRES-X Portable Digital Node by connecting a compatible C4FM digital transceiver (FT2D as 12/2018) and a personal computer.

2. DG-ID Subcodes are implemented: When the DG-ID of the node station is set to "00" (Open Node Station), it is now possible to set an additional two-digit Subcode from "00" to "26". When the Subcode is set to "00", the C4FM digital signals of all DG-ID numbers is relayed. When the Subcode is set from "01" to "26", only C4FM digital signals with a matching Subcode will be relayed.

By utilizing a Subcode, it is possible to avoid interference where there are multiple Open Node Stations (DG-ID number: 00) operating within local communication range of the mobile station (user station).

Example) "00 - 01" = DG-ID number (00) and Subcode (01)

3. We added a setting to the WIRES-X PC software to open a dedicated digital room that only Digital Node Stations can connect to.

(A node station connected with HRI-200 is required to open rooms.)

4. Other improvements and optimization were done.

FT2DR/DE Firmware versions update information:

- MAIN Firmware Version ver.2.02 → ver.3.10
- SUB Firmware Version ver.2.01 (No change)
- DSP PCTOOLe Ver. 4.30 → ver.4.31

(Update content)

Added WIRES-X Portable Digital Node functions.

It is now possible to operate a Portable Digital Node station when connected with a PC using WIRES-X Portable Digital Node function.

If you already have Ver. 1.500 software, it is not necessary to update again.

We hope this new software will increase your enjoyment of the WiRES-X. Thank you for choosing Yaesu radios. If you have any problems or questions please contact Yaesu Amateur Tech Support amateurtech@yaesu.com.
